Introduction

Reactome is an open-source, open-access, manually curated, and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Integrin cell surface interactions

Stable identifier: R-HSA-216083

The extracellular matrix (ECM) is a network of macro-molecules that underlies all epithelia and endothelia and that surrounds all connective tissue cells. This matrix provides the mechanical strength and also influences the behavior and differentiation state of cells in contact with it. The ECM are diverse in composition, but they generally comprise a mixture of fibrillar proteins, polysaccharides synthesized, secreted and organized by neighboring cells. Collagens, fibronectin, and laminins are the principal components involved in cell matrix interactions; other components, such as vitronectin, thrombospondin, and osteopontin, although less abundant, are also important adhesive molecules.

Integrins are the receptors that mediate cell adhesion to ECM. Integrins consists of one alpha and one beta subunit forming a noncovalently bound heterodimer. 18 alpha and 8 beta subunits have been identified in humans that combine to form 24 different receptors.

The integrin dimers can be broadly divided into three families consisting of the beta1, beta2/beta7, and beta3/alphaV integrins. beta1 associates with 12 alpha-subunits and can be further divided into RGD-, collagen-, or laminin binding and the related alpha4/alpha9 integrins that recognise both matrix and vascular ligands. beta2/beta7 integrins are restricted to leukocytes and mediate cell-cell rather than cell-matrix interactions, although some recognize fibrinogen. The beta3/alphaV family members are all RGD receptors and comprise aIIbb3, an important receptor on platelets, and the remaining b-subunits, which all associate with alphaV. It is the collagen receptors and leukocyte-specific integrins that contain alpha A-domains.

Collagen types III, IV, V, VI, VIII, IX, XVI bind integrins alpha1beta1 and alpha2beta1

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-2327695

**Type:** binding

**Compartments:** plasma membrane, extracellular region

The widely-expressed collagen receptors integrin alpha2beta1 and alpha1beta1 both bind collagen types I-IV (Tulla et al. 2001). Integrin alpha1beta1 binds to collagen type IV and VI with higher affinity than to types I-III, whereas alpha2beta1 has a higher affinity for collagen types I-III than for type IV (Tulla et al. 2001). Binding to collagen type I occurs at a site corresponding to residues 502-516 of the collagen alpha-1(I) chain (Knight et al. 1998, 2000, Xu et al. 2000).

Integrin alpha2beta1 also binds collagen types VIII (Saelman et al. 1992), IX (Käpylä et al. 2004), XI (Tuckwell et al. 1995), the noncollagenous domain 1 (NC1) of collagen types VII and X (Chen et al. 1999), and collagen type XVI, though this is bound with higher affinity by integrin alpha1beta1 (Eble et al. 2006). Both integrins interact with collagen XVI via the A-domain of their alpha-subunits. A tryptic fragment of collagen XVI comprising collagenous domains 1–3 is bound by integrin alpha1beta1. Electron microscopy of this complex or integrin alpha1beta1 with full-length collagen XVI revealed two unique integrin alpha1beta1 binding sites (GLQGER and GIKGER) within the N-terminal half of the COL2 domain of collagen XVI (Grässel & Bauer 2013).

Integrin alpha1beta1 also binds collagen types IX (Käpylä et al. 2004), XVI (Eble et al. 2006), VIII though less strongly than alpha2 beta1 (Saelman et al. 1992), XIII (Nykvist et al. 2000) and arresten, the NC1 of alpha-1 type IV collagen (Sudhakar et al. 2005).

Integrin alpha10beta1 is able to bind collagen types I-VI, with a stronger binding affinity for types IV and VI, similar to the preferences of integrin alpha1beta1 (Tulla et al. 2001).

Integrin alpha11beta1 mediates cell adhesion to collagen types I and IV with a preference for I (Tiger et al. 2001).

Integrins alphaVbeta3 (Sudhakar et al. 2003) and alpha3beta1 (Borza et al. 2006) can bind tumstatin, the cleaved NC1 of alpha-3 type IV collagen. Integrins alphaVbeta3 and alphavbeta5 can bind camstatin, the cleaved NC1 of alpha-2 type IV collagen (Magnon et al. 2005).

Collagen type I binds integrin alpha1beta1, alpha2beta1, alpha10beta1

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-114563

**Type:** binding

**Compartments:** extracellular region, plasma membrane

**Inferred from:** Collagen type I binds integrin alpha1beta1, alpha2beta1, alpha10beta1 (Homo sapiens)

Integrin alpha1beta1 binds to collagen type IV and VI with higher affinity than to types I-III, whereas alpha2beta1 has a higher affinity for collagen types I-III than for type IV. Integrin alpha10beta1 binds collagen types I, IV, and VI with similar affinities (Tulla et al. 2001). Integrin alpha11beta1 binds preferentially to the fibril-forming collagen types I and II, binding to type III is weaker and collagens IV and VI are poor ligands (Zhang et al. 2003).

Binding to collagen type I occurs at sites corresponding to the six-residue sequence G(F/L)GER (Knight et al. 1998, 2000, Xu et al. 2000).

Integrin alpha2beta1 is the major platelet collagen receptor (Kunicki et al. 1988). It requires Mg2+ to interact with collagen and may require initiation mediated by the activation of Integrin alphaIIbBeta3 (van de Walle 2007).

Collagen type I binds integrin alpha11beta1

Location: Integrin cell surface interactions

Stable identifier: R-HSA-216045

Type: binding

Compartments: extracellular region, plasma membrane

The integrin alpha11beta1 along with alpha1beta1, alpha2beta1 and alpha10beta1 are referred to as a collagen receptor subgroup of the integrin family. Integrin alpha11beta1 binds preferentially to the fibril-forming collagen types I and II, binding to type III is weaker and collagens IV and VI are poor ligands (Zhang et al. 2003).

Collagen type X binds Integrin alpha2beta1

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-2470555

**Type:** binding

**Compartments:** plasma membrane, extracellular region

**Inferred from:** Collagen type X binds integrin alpha2beta1 (Homo sapiens)

The NC1 domains of collagen types VII (Chen et al. 1999) and X (Luckman et al. 2003) interact with integrin alpha2beta1. During endochondrial ossification, collagen type X is deposited in the hypertrophic zone of the growth plate. It interacts directly with chondrocytes via integrin alpha2beta1 (Luckman et al. 2003).

Collagen type XIII binds Integrin alpha1beta1

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-2484965

**Type:** binding

**Compartments:** plasma membrane

Integrin alpha1beta1 is a negative feedback regulator of collagen synthesis (Gardner et al. 1999). CHO cells expressing human integrin alpha1beta1, but not cells expressing integrin alpha2beta1, were able to bind recombinant human collagen type XIII, promoting cell spreading (Nykvist et al. 2000).

**Literature references**

Collagen type XXIII binds Integrin alpha2beta1

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-2473511

**Type:** binding

**Compartments:** plasma membrane

**Inferred from:** Collagen type XXIII binds Integrin alpha2beta1 (Homo sapiens)

Collagen type XXIII, a transmembrane collagen, binds integrin alpha2beta1, the only collagen-binding integrin present in the epidermis, in an ion- and conformation-dependent manner. Binding is sufficient to induce integrin alpha2beta1-dependent attachment and spreading of keratinocytes (Veit et al. 2007, 2011).

THBS1 (Thrombospondin-1) binds Integrin alpha3beta1, alpha4beta1

Location: Integrin cell surface interactions

Stable identifier: R-HSA-265429

Type: binding

Compartments: extracellular region, plasma membrane

The alpha3beta1 integrin is localized in cell-cell junctions of endothelial cells and this integrin is involved in regulating angiogenesis by interacting with thrombospondin-1 (TSP1). Alpha4beta1 integrin binds to the N-terminal pentraxin modules of TSP1 and stimulates chemotaxis and modulates T cell behavior both positively and negatively.

Integrins alpha4beta1, alpha8beta1, alphaVbeta1, alphaVbeta3, alphaVbeta6 bind Fibronectin matrix

Location: Integrin cell surface interactions

Stable identifier: R-HSA-216050

Type: binding

Compartments: extracellular region, plasma membrane

Several integrins are able to bind fibronectin (FN1). Alpha5beta1 is a specialist FN1 receptor (Singh et al. 2010). The alpha4beta1 (VAL-4) integrin has been suggested to play an important role in haemopoiesis. Fibronectin and VCAM-1 are the main ligands for VLA-4. The H1 region present in all FN isoforms represents the binding site for VLA-4, alphaIIbBeta3, which is highly expressed on platelets where it predominantly binds fibrinogen leading to thrombus formation but also binds FN1 (Savage et al. 1996). Alpha4beta1 mediates cell-cell contacts and cell-matrix contacts through the ligands VCAM-1 and FN1, respectively (Humphries et al. 1995), this is suggested to play an important role in haemopoiesis. The H1 region present in all FN isoforms represents the binding site for VLA-4. Integrins alpha3beta1, alpha4beta7, alphaVbeta1, 3 (Wu et al. 1996, Johansson et al. 1997), 6 (Busk et al. 1992) and alpha8beta1 (Muller et al. 1995, Farias et al. 2005) are all able to bind FN1.

Tenacious binding of free fibronectin to cells leads to enhanced fibronectin matrix assembly and the formation of a polymerized fibronectin "cocoon" around the cells. This process is enhanced in the presence of CEACAM molecules.

**SPP1 (osteopontin) binds integrin alpha5beta1, alpha9beta1**

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-265424

**Type:** binding

**Compartments:** extracellular region, plasma membrane

Osteopontin (SPP1) is a highly phosphorylated sialoprotein that is a prominent component of the mineralized extracellular matrices of bones and teeth. It provides an adhesive matrix for endothelial and smooth muscle cells during remodeling of the vascular wall following injury. SPP1 binds multiple integrins including alphaVbeta3, alphaVbeta1 and alphaVbeta5 (Liaw et al. 1995), alpha5beta1 (Barry et al. 2000), alpha9beta1 (Smith et al. 1996, Yokosaki et al. 1999) alpha4beta1 (Bayless et al. 1998), alpha8beta1 (Denda et al. 1998) and the receptor CD44 (Katagiri et al. 1999). Integrin alpha4beta1 is expressed on leukocytes, differentiated vascular smooth muscle cells and tumor cells. It has been shown to mediate leukocyte attachment to OPN.

Osteopontin (SPP1) is a highly phosphorylated sialoprotein that is a prominent component of the mineralized extracellular matrices of bones and teeth. It provides an adhesive matrix for endothelial and smooth muscle cells during remodeling of the vascular wall following injury. SPP1 binds multiple integrins including alphaVbeta3, alphaVbeta1 and alphaVbeta5 (Liaw et al. 1995), alpha5beta1 (Barry et al. 2000), alpha9beta1 (Smith et al. 1996, Yokosaki et al. 1999) alpha4beta1 (Bayless et al. 1998), alpha8beta1 (Denda et al. 1998) and the receptor CD44 (Katagiri et al. 1999). Integrin alpha4beta1 is expressed on leukocytes, differentiated vascular smooth muscle cells and tumor cells. It has been shown to mediate leukocyte attachment to OPN.

SPP1 (osteopontin) binds CD44

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-2752115

**Type:** binding

**Compartments:** plasma membrane, extracellular region

Osteopontin (SPP1) is a member of the small integrin-binding ligand N-linked glycoprotein (SIBLING) family of proteins (Bellahcène et al. 2008). It is a highly phosphorylated sialoprotein and prominent component of the mineralized extracellular matrices of bones and teeth. It binds multiple integrins including alphaVbeta3, alphaVbeta1 and alphaVbeta5 (Liaw et al. 1995) alpha9beta1 (Smith et al. 1996, Yokosaki et al. 1999), alpha4beta1 (Bayliss et al. 1998) and the receptor CD44 (Weber et al. 1996, Katagiri et al. 1999). The SPP1–CD44 interaction may be important for colorectal cancer progression (Rao et al. 2013).

VCAM1 binds Integrin alpha4beta1

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-198941

**Type:** binding

**Compartments:** plasma membrane

Integrins play a central role in mediating lymphocyte adhesion to a number of surfaces. Integrin alphaL-beta2 (LFA-1) interacts with Intercellular adhesion molecule (ICAM)1-5, which are typically expressed on other immune system cells. ICAM4 and 5 are known to be expressed on telencephalic neurons.

VCAM-1 regulates lymphocyte adhesion to activated endothelial cells via Very Late Antigen-4 (VLA-4). To function in a circulating mode, leukocytes express LFA-1 and VLA-4 in a low ligand binding capacity. When leukocytes reach sites of inflammation, these integrins are switched to a higher binding state to guide the complex process of transmigration, tethering, rolling, arrest, adhesion and shape change. Signal cascades between LFA-1 and VLA-4 may cross-talk affecting binding affinities in a reciprocal fashion.

Integrin alpha4beta1 binds JAM2:JAM3

Location: Integrin cell surface interactions

Stable identifier: R-HSA-202706

Type: binding

Compartments: plasma membrane

Several key IgSF cell adhesion molecules engage integrin and in so doing impact on the multi-step paradigm of leukocyte emigration. The interaction between JAM2 (JAM-B) and Integrin alpha4beta1 (VLA-4) requires prior binding of JAM2 to JAM3 (JAM-C).

Literature references

**ITGA4:ITGB1 binds natalizumab**

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-9679740

**Type:** binding

**Compartments:** plasma membrane, extracellular region

Integrins are the receptors that mediate cell adhesion to the extracellular matrix (ECM). They are involved in cell adhesion and recognition in a variety of processes including embryogenesis, hemostasis, tissue repair, immune response and metastatic diffusion of tumor cells. Integrin alpha-4 (ITGA4) is a receptor for fibronectin. ITGA4 functions as a heterodimer of an alpha subunit and the beta subunit of either the beta-1 chain or the beta-7 chain (ITGA4:ITGB1 shown here).

Natalizumab (Tysabri) is a humanised monoclonal antibody against the cell adhesion molecule α4-integrin. It is a medication used to treat multiple sclerosis and Crohn's disease (No authors 2004). It binds to the α4-subunit of α4b1 and α4b7 integrins expressed on the surface of all leukocytes except neutrophils, and inhibits the α4-mediated adhesion of leukocytes to their counter-receptors. This is thought to reduce the ability of inflammatory immune cells to attach to and pass through the cell layers lining the intestines and blood–brain barrier (Rice et al. 2005).

Interaction of integrin alpha8beta1 with Tenascin-C

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-216064

**Type:** binding

**Compartments:** extracellular region, plasma membrane

Tenascin-C (TN-C) and its isoforms are multidomain extracellular matrix (ECM) proteins that are believed to be involved in the regulation of stromal-epithelial interactions. Some of the interactions between TN-C and cells are mediated by integrins. Alpha8beta1 integrin interacts with the third FN type III repeats which contains an RGD sequence in tenascin-c.

Interaction of integrin alpha9beta1 with VCAM1

Location: Integrin cell surface interactions

Stable identifier: R-HSA-265428

Type: binding

Compartments: plasma membrane

Integrin alpha9beta1 is widely expressed on smooth muscle, epithelial cells, and highly and specifically expressed on neutrophils. VCAM-1 is one of the effective ligands for the integrin alpha9beta1. This interaction mediates the neutrophile migration on VCAM-1 and extravasation of neutrophils at sites of acute inflammation.

Interaction of integrin alphaDbeta2 with fibrin

Location: Integrin cell surface interactions

Stable identifier: R-HSA-216069

Type: binding

Compartments: extracellular region, plasma membrane

Integrin alphaDbeta2 is a member of the beta2 family. It is expressed poorly on peripheral blood leukocytes but strongly on macrophages. alphaDbeta2 has the ability to interact with multiple ligands, including many ECM proteins. The interaction of beta2 integrins with ligands is mediated by their I-domains of the alpha subunits. The alphaD I-domain mediates the interaction with the ECM protein fibrinogen.

VTN (vitronectin) binds Integrin alphaVbeta3, alphaVbeta5, alphaVbeta8

Location: Integrin cell surface interactions

Stable identifier: R-HSA-216076

Type: binding

Compartments: extracellular region, plasma membrane

Integrin alphaVbeta3 is highly expressed on osteoclasts, bone resorbing cells and is upregulated during vascular damage, angiogenesis and certain type of malignancies. It binds to vitronectin by recognizing the conserved RGD sequence within the N-terminal region. Integrin alphaVbeta3 plays an important role in signal transduction and regulation of osteoclast function. The integrin alphaVbeta5 receptor also interacts with vitronectin, promoting cell spreading. Integrin alphaVbeta8 can bind vitronectin as well as fibrin.

Interaction of integrin alphaIIb beta 3 with THBS1 (Thrombospondin-1)

Location: Integrin cell surface interactions

Stable identifier: R-HSA-349603

Type: binding

Compartments: extracellular region, plasma membrane

Thrombospondin-1 (TSP-1) secreted from platelet alpha granules on thrombin activation associates with actin cytoskeleton. This association of TSP-1 with actin cytoskeleton is mediated by the membrane receptor alphaIIbbeta3.

LUM (lumican) binds integrin alpha2beta1

Location: Integrin cell surface interactions

Stable identifier: R-HSA-4085133

Type: binding

Compartments: extracellular region, plasma membrane

Lumican (LUM) is the major leucine-rich keratan sulfate proteoglycan of the corneal stroma, also found in the extracellular matrices of skin, muscle and cartilage. Lum null mice have corneal opacity as well as skin and tendon fragility associated with disorganized and loosely packed collagen fibers (Jepsen et al. 2002, Chakravarti et al. 2003). LUM binds integrin alpha2beta1 (Zeltz et al. 2010), downregulating MMP-14 expression (Niewiarowska et al. 2011).

AGRN binds Integrins alphaVbeta1 (Other beta1-containing integrins)

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-2467436

**Type:** binding

**Compartments:** plasma membrane, extracellular region

**Inferred from:** Agrin binds Integrin alphaVbeta1 (alpha1beta1) (Gallus gallus)

Agrin (AGRN) is a >400 kDa multi-domain heparan sulfate proteoglycan found in basement membranes. It is a critical organizer of postsynaptic differentiation at the skeletal neuromuscular junction; synaptogenesis is profoundly disrupted in its absence (Gautam et al. 1996). Two alternate N-termini exist. The predominant longer LN form (Burgess et al. 2000) starts with a secretion signal sequence and a laminin-binding domain (Denzer et al. 1995, Kammerer et al. 1999); the shorter SN form associates with the plasma membrane (Burgess et al. 2000, Neumann et al. 2001). Following the SN or LN regions are 8 follistatin repeats, known to bind growth factors and inhibit proteases in other proteins. The central region has two repeats homologous to domain III of laminin. The C-terminal portion, which is responsible for the molecule's known signaling functions, contains four EGF repeats and three LG (G) domains homologous to those found in laminin alpha chains, neurexins and slits (Timpl et al. 2000).

COMP binds Integrin alpha5beta1, Integrin alphaVbeta3, CD47

Location: Integrin cell surface interactions

Stable identifier: R-HSA-2426259

Type: binding

Compartments: extracellular region, plasma membrane

Cartilage oligomeric matrix protein (COMP, thrombospondin-5) is a 524-kDa pentameric glycoprotein expressed primarily in cartilage, tendon, ligament and synovium. In adult cartilage, COMP has been shown to be located primarily in the inter-territorial matrix between chondrocytes (Murphy et al. 1999). The mature protein is pentameric with each monomer linked to its neighbour by a disulphide bond, located at the amino terminus of the protein (Hedbom et al. 1992, Morgelin et al. 1992).

COMP binds integrin alpha5beta1 (Chen et al. 2005), integrin alphaVbeta3 (Neidhart et al. 2005) and CD47 (also known as integrin-associated peptide or IAP, Rock et al. 2010) on the cell surface of chondrocytes and fibroblasts.

Endorepellin binds KDR (VEGFR2)

**Location:** Integrin cell surface interactions

**Stable identifier:** R-HSA-4088281

**Type:** binding

**Compartments:** plasma membrane, extracellular region

Endorepellin is the C-terminal domain V of perlecan, constituting amino acids 3687–4391 (Mongiat et al. 2004). It has anti-angiogenic properties, blocking endothelial cell adhesion to fibronectin and type I collagen (Mongiat et al. 2003). Endorepellin and a smaller fragment constituting the third laminin G–like (LG) domain (LG3) disrupt actin stress fibers and focal adhesions via an interaction with the collagen receptor alpha2beta1 integrin (Bix et al. 2004). The first and second laminin G domains 1 of endorepellin bind specifically and with high affinity to Ig domains 3–5 of VEGFR2 (Willis et al. 2013).

## Table of Contents

### Introduction

- Integrin cell surface interactions

- Collagen types III, IV, V, VI, VIII, IX, XVI bind integrins alpha1beta1 and alpha2beta1
- Collagen type I binds integrin alpha1beta1, alpha2beta1, alpha10beta1
- Collagen type I binds integrin alpha11beta1
- Collagen type II binds integrin alpha2beta1, alpha1beta1, alpha11beta1
- Collagen type III binds integrin alpha10beta1
- Collagen type IV networks bind integrins alpha1beta1, alpha2beta1
- Collagen type VII binds integrin alpha2beta1
- Collagen type VIII binds integrin alpha1beta1
- Collagen type X binds Integrin alpha2beta1
- Collagen type XIII binds Integrin alpha1beta1
- Collagen type XXIII binds Integrin alpha2beta1
- Collagen types VI, IX bind integrin alpha10beta1
- Collagen type IV binds integrin alpha10beta1
- Collagen type IX binds integrin alpha11beta1
- Arresten binds integrin alpha1beta1
- Endostatin binds integrin alphaVbeta3, alphaVbeta5, alpha3beta1, alpha5beta1
- Tumstatin binds integrin alphaVbeta 3, alpha3beta1
- Canstatin binds integrins alphaVbeta3, alphaVbeta5
- Tetrastatin binds integrin alphaVbeta3
- THBS1 (Thrombospondin-1) binds Integrin alpha3beta1, alpha4beta1
- Integrins alpha4beta1, alpha8beta1, alphaVbeta1, alphaVbeta3, alphaVbeta6 bind Fibronectin matrix
- SPP1 (osteopontin) binds integrin alpha5beta1, alpha9beta1
- SPP1 (osteopontin) binds Integrin alpha4beta1
- SPP1 (osteopontin) binds integrin alpha8beta1
- SPP1 (osteopontin) binds integrins alphaVbeta1, alphaVbeta3, alphaVbeta5
- SPP1 (osteopontin) binds CD44
- VCAM1 binds Integrin alpha4beta1
- Integrin alpha1beta1 binds JAM2:JAM3
- ITGA4:ITGB1 binds natalizumab
- MADCAM-1 binds Integrin alpha4beta7
- Interaction of integrin alpha8beta1 with Tenascin-C
- Interaction of integrin alpha9beta1 with VCAM1
- Interaction of integrin alpha9beta1 with Tenascin-C
Interaction of integrin alphaDbeta2 with fibrin

Interaction of integrin alphaXbeta2 with fibrin

VTN (vitronectin) binds Integrin alphaVbeta3, alphaVbeta5, alphaVbeta8

Integrin alphaXbeta2 binds JAM3

ICAM1-5 bind Integrin alphaLbeta2 (LFA-1)

Integrin alphaLbeta2 (LFA-1) binds F11R (JAM-A)

Integrin alphaMbeta2 (MAC1) binds JAM3

BSG (basigin) binds Integrin alpha3beta1, alpha6beta1

Interaction of integrin alphaVbeta3 with IPSP (Bone sialoprotein 2)

Interaction of integrin alphaVbeta3 with Tenascin

Interaction of integrin alphaVbeta3 with Fibrillin

Interaction of integrin alphaVbeta3 with von Willbrand Factor

Interaction of integrin alphaVbeta3 with PECAM1

Interaction of integrin alphaEbeta7 with Cadherin-1

Interaction of integrin alphaIIbbeta3 with Fibronectin

Adhesion of integrin alphaIIbbeta3 to fibrin network

Interaction of integrin alphaIIbbeta3 with von Willebrand factor

Interaction of integrin alphaIIb beta 3 with THBS1 (Thrombospondin-1)

LUM (lumican) binds integrin alpha2beta1

AGRN binds Integgrins alphaVbeta1 (Other beta1-containing integrins)

COMP binds Integrin alpha5beta1, Integrin alphaVbeta3, CD47

Endorepellin binds KDR (VEGFR2)

Endorepellin binds alpha2beta1 integrin
