This is just an excerpt of a full-length report for this pathway. To access the complete report, please download it at the Reactome Textbook.

15/11/2022
Introduction

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Repression of WNT target genes

Stable identifier: R-HSA-4641265

Compartments: nucleoplasm

In the absence of a WNT signal, many WNT target genes are repressed by Groucho/TLE. Groucho was initially identified in Drosophila, where it has been shown to interact with a variety of proteins to repress transcription (reviewed in Turki-Judeh and Courey, 2012). Groucho proteins, including the 4 human homologues (transducin-like enhancer of split (TLE) 1-4), do not bind DNA directly but instead are recruited to target genes through interaction with DNA-binding transcription factors including TCF/LEF (Brantjes et al, 2001; reviewed in Chen and Courey, 2000). Groucho proteins are believed to oligomerize in a manner that depends on an N-terminal glutamine-rich Q domain, and oligomerization may be important for function (Song et al, 2004; Pinto and Lobe, 1996). Groucho/TLE proteins affect levels of gene expression by interacting with the core transcriptional machinery as well as by modifying chromatin structure through direct interaction with histones and recruitment of histone deacetylases, among other mechanisms (reviewed in Turki-Judeh and Courey, 2012). In addition to the four TLE proteins, human cells also include a truncated TLE-like protein called amino-terminal enhancer of split (AES) which contains the N-terminal Q domain but lacks much of the C-terminal sequence of TLE proteins, including the WD domain which is important for many protein-protein interactions. AES is believed to act as a dominant negative, since it is able to heter-oligomerize with full-length TLE proteins to form non-functional complexes (Brantjes et al, 2001; reviewed in Beagle and Johnson, 2010).

TCF/LEF binds WNT promoters

**Location:** Repression of WNT target genes

**Stable identifier:** R-HSA-8944352

**Type:** binding

**Compartments:** nucleoplasm

TCF7 (TCF1), LEF1, TCF7L1 (TCF3) and TCF7L2 (TCF4) are HMG box-containing DNA-binding proteins that recognize WNT-responsive elements (WREs) in the promoters of WNT target genes. The WRE consensus sequence is CCTTTGWW, where W represents either T or A (reviewed in Brantjes et al, 2002). In the absence of a WNT signal, promoter-bound TCF/LEF is bound by one of four Groucho homologues, TLE1, 2, 3 or 4 (Levanon et al, 1998; Brantjes et al, 2001; Daniels and Weis, 2005). Groucho/TLE proteins are co-repressors for a variety of DNA-binding transcription factors and mediate repression at least in part through their interaction with histone deacetylases such as RPD3/HDAC1 (Arce et al, 2009; Brantjes et al, 2001; Chen et al, 1999; reviewed in Chen and Courey, 2000).

Groucho proteins have been shown to homo-tetramerize through a glutamine rich Q domain at the N-terminus, and this oligomerization is required for repression. The Q domain is also sufficient for interaction with TCF/LEF proteins (Brantjes et al, 2001; Chen et al, 1998; Pinto and Lobe, 1996; Song et al, 2004). Studies with purified proteins have shown that human TLE1 and 2 bind to an amino-terminal truncated form of LEF1(69-397) with an affinity comparable to that for full length LEF1 (Daniels and Weis, 2005).

TLE recruits HDAC1 to WNT promoters

Location: Repression of WNT target genes

Stable identifier: R-HSA-4641231

Type: binding

Compartments: nucleoplasm

Inferred from: xTLE4 binds HDAC1 (Homo sapiens)

Groucho/TLE mediates repression of WNT target genes in part by recruiting a histone deacetylase to the promoter. The weakly conserved central GP domain of Groucho/TLE has been shown to interact with the histone deacetylase RPD3/HDAC1 (Brantjes et al, 2001; Chen et al, 1999). Knockdown of rpd3 in Drosophila cells, or treatment of human or Drosophila cells with the histone deacetylase inhibitor Trichostatin A significantly decreases repression of a Groucho/TLE dependent reporter gene, and Groucho and RPD3 have been shown to co-localize to chromatin of target genes by ChIP leading to deacetylation of H3K9, H3K14, K4K5, H4K8 and H4K12 (Chen et al, 1999; Choi et al 1999; Winkler et al, 2010).

TLE forms non-functional complexes with AES

**Location:** Repression of WNT target genes

**Stable identifier:** R-HSA-4649028

**Type:** binding

**Compartments:** nucleoplasm

**Inferred from:** Gro binds Aes (Drosophila melanogaster)

AES is a naturally occurring truncated form of TLE that contains only the Q and GP domain. AES has been shown to have a dominant negative effect on TLE-mediated repression (Miyasaka et al, 1993; Roose et al, 1998; Ren et al, 1999; Swingler et al, 2004). AES is believed to form oligomers with full length TLE proteins mediated by the Q domains; because AES is unable to interact with HDAC1, these oligomers are thought to be non-functional (Muhr et al, 2001; Brantjes et al, 2001).

TCF7L2/TCF7L1 bind CTBP1 to repress WNT target genes

**Location:** Repression of WNT target genes

**Stable identifier:** R-HSA-5334050

**Type:** binding

**Compartments:** nucleoplasm

In addition to repressing WNT-dependent targets through Groucho/TLE proteins, some TCF/LEF transcription factors may also work by recruiting the CTBP1 and CTBP2 repressors (Duval et al, 2000). CTBP-binding regions are present in the 'E-form' splice variants of TCF7L2 and in TCF7L1 and in vitro interactions have been demonstrated in Xenopus and mammals, although the in vivo relevance of these interactions is unclear (Brannon et al, 1999; Valenta et al, 2003; Cuilliere-Dartigues et al, 2006; Tang et al, 2008; Hamada and Bienz, 2004). Abrogation of the interaction interface results in a loss of TCF-CTBP colocalization and increased expression of a TCF-dependent reporter gene (Cuilliere-Dartigues et al, 2006; Tang et al, 2008).

Transcription of canonical WNT targets is repressed by the TLE:HDAC and TCF/CT-BP complexes

Location: Repression of WNT target genes
Stable identifier: R-HSA-5229348
Type: omitted
Compartments: nucleoplasm

Transcription of WNT genes is repressed in the absence of WNT signal by TLE:HDAC complexes (reviewed in Cinnamon and Paroush, 2008; Saito-Diaz et al, 2013). Represssion may also be mediated by CT-BP proteins binding to TCF7L1 and TCF7L3 (Duval et al, 2000; Cuilliere-Dartigues et al, 2006; Tang et al, 2008).
