Defective Intrinsic Pathway for Apoptosis

Due to p14ARF Loss of Function

Introduction

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

Defective Intrinsic Pathway for Apoptosis Due to p14ARF Loss of Function

Stable identifier: R-HSA-9645722

Diseases: cancer

Cancer-derived missense mutations in the CDKN2A gene that affect the C-terminal arginine-rich region of p14ARF (also known as CDKN2A transcription isoform 4, CDKN2A-4, p14 or ARF) impair p14ARF binding to the mitochondrial matrix protein C1QBP and interfere with p53-mediated apoptosis. Many mutations in the CDKN2A locus that affect C-terminal arginines of p14ARF are silent in p16INK4A (CDKN2A-1) (Itahana and Zhang 2008).

Literature references

p14ARF mutants do not bind C1QBP

Location: Defective Intrinsic Pathway for Apoptosis Due to p14ARF Loss of Function

Stable identifier: R-HSA-9645766

Type: transition

Compartments: cytosol

Diseases: cancer

Several cancer-derived missense mutations in the CDKN2A gene result in substitution of arginine residues in the C-terminal arginine-rich region of p14ARF (CDKN2A-4). p14ARF mutants p14ARF R81G, p14ARF R82C, p14ARF R87C, p14ARF R88Q, p14ARF R90H, p14ARF R98Q, p14ARF R99C and p14ARF R98L;R99S are unable to bind to C1QBP (p32) and they do not localize to mitochondria. Binding of these mutants to other p14ARF interacting proteins, such as MDM2 and NPM1 (B23), remains unaffected. Mutations in p14ARF that affect binding to C1QBP interfere with p53-mediated apoptosis (Itahana and Zhang 2008).

Missense mutations affecting arginine residue R98 have also been reported to affect p14ARF localization to nucleolus and to diminish, due to partial mislocalization, the ability of p14ARF to sequester MDM2 (Zhang et al. 1999).
