Unphosphorylated nucleoprotein translocates to the plasma membrane

Acencio, ML., Stephan, R.
**Introduction**

Reactome is open-source, open access, manually curated and peer-reviewed pathway database. Pathway annotations are authored by expert biologists, in collaboration with Reactome editorial staff and cross-referenced to many bioinformatics databases. A system of evidence tracking ensures that all assertions are backed up by the primary literature. Reactome is used by clinicians, geneticists, genomics researchers, and molecular biologists to interpret the results of high-throughput experimental studies, by bioinformaticians seeking to develop novel algorithms for mining knowledge from genomic studies, and by systems biologists building predictive models of normal and disease variant pathways.

The development of Reactome is supported by grants from the US National Institutes of Health (P41 HG003751), University of Toronto (CFREF Medicine by Design), European Union (EU STRP, EMI-CD), and the European Molecular Biology Laboratory (EBI Industry program).

**Unphosphorylated nucleoprotein translocates to the plasma membrane**

**Stable identifier:** R-HSA-9694373

**Type:** omitted

**Compartments:** cytosol, plasma membrane

**Diseases:** COVID-19

**Inferred from:** Unphosphorylated nucleoprotein translocates to the plasma membrane (Homo sapiens)

This COVID-19 event has been created by a combination of computational inference (see https://reactome.org/documentation/inferred-events) from SARS-CoV-1 data and manual curation, as described in the summation for the overall SARS-CoV-2 infection pathway.

Significant amounts of the unphosphorylated N protein are associated with the cell membrane (Surjit et al, 2005)
